WHOOPING COUGH MORBIDITY

EDMONTON, 1931 - 1950

This disease has been characterized by a high peak of incidence every third year until Sauer-type vaccine was introduced in 1942. Since that time these peaks are markedly lowered and are further apart. This has occurred during a period of rapid increase and overcrowding in our population.

Annual Report of the Medical Officer of Health

Chairman and Members, Local Board of Health, Edmonton, Alberta.

Gentlemen:

Herewith is submitted a report of the activities of our Board and certain other health agencies of the City during 1950:

BIRTHS:

Our birth-rate per 1,000 population showed only a slight increase, so that the total increase of 376 babies born to residents in 1950 indicates chiefly our increase in population. That nearly one-third the 6,813 babies born in the City were to non-residents presents a measure of the considerable area outside our City for which local institutions are providing hospital beds.

DEATHS:

Our general death-rate at 7.6 per 1,000 population gave a slight increase. The chief cause of death, heart disease, showed some reduction. The second cause of death, cancer, continued to increase. Increase of death from cancer is to be expected in a population whose average age is increasing; but if our citizens will pay attention to those early signs of cancer and will seek prompt attention, there is no doubt many deaths from this disease may be prevented.

Our infant mortality rate of 25.5 per 1,000 living births gives a slight increase, but remains amongst the lowest on this continent.

COMMUNICABLE DISEASES:

A total increase in communicable diseases was due chiefly to extensive outbreaks of mumps and rubella. The incidence of serious communicable disease, however, remained low, although some increase in tuberculosis and venereal disease were recorded. Only one case of diphtheria and thirty cases of whooping cough marks a satisfying result of continued immunization against these diseases. For the same reason we have had no case of smallpox in our City since 1936.

CLINICS:

Our Well-Baby and Pre-School Clinic again showed an increased attendance to 15,322. Here supervision is given the physical development of the growing child, and assistance given with infant feeding and other problems. In addition, 2,564 home visits were made by nurses from this clinic to advise mothers in the home.

Citizens have used our Immunization Clinic freely, and to this we give much credit for the control of such serious communicable diseases as diphtheria, whooping cough and smallpox. The attendance at this clinic during the year was 21,624.

SANITATION:

From the sanitary standpoint, general cleanliness of the City has been good. However, considerable refuse blows about our streets at times. Examination of this material indicates that much of it has been thrown on the street by careless citizens. Most of this material is not insanitary, but creates untidy streets. This is especially bad in the spring when the winter's accumulation becomes evident. If we can increase the number of trash collecting boxes in the business areas and at bus stops in outlying areas, much of this debris will eventually be kept off the streets.

Sanitary supervision of restaurants, stores and other food handling establishments is producing increasingly good results as indicated by our bacteriological control of these places.

Constant supervision of our milk supply is maintained on farms, in milk plants and delivery wagons, and 9,741 samples of milk were tested for purity.

Daily samples of the City water supply were examined for bacteria and for chlorine content. The water from a number of private wells was tested, as were regular samples from City and private swimming pools.

Our veterinarian, who inspects all animals slaughtered in our two non-exporting abattoirs, condemned 28,012 pounds of diseased meats. By far the greatest single cause of such condemnation was tuberculosis in pork, which accounted for 12,764 pounds.

GENERAL:

The rapid increase in our population has continued, and with it has increased the demand for public health services. In the face of the need for expansion and possibly re-organization of these servicies, co-ordination of the various services as far as possible seems an effective economic and timely measure. Some financial help now promised to cities by the Province should facilitate bringing this about. Indeed, both provincially and municipally there are various groups doing an excellent piece of public health work, but who could enhance the value to our citizens by maintaining closer co-ordination of these groups.

We have co-operated to the extent of our facilities in the teaching of nurses from various hospitals and nurses and medical students from the University of Alberta.

Many of our citizens are still forced to live in unsatisfactory housing. The answer to this problem is, of course, economic. The solution is likely to be made more difficult by semi-war-time restrictions and costs plus a continuing rapid increase of our population. The remedy lies beyond the public health field; but I see this as one of the greatest present hazards to the physical and mental welfare of a considerable part of our population.

Respectfully submitted,

G. M. LITTLE, MEDICAL OFFICER OF HEALTH.

Communicable disease was responsible for 47 or 4.1% of the 1,141 City deaths during 1950.

Of these 47 deaths, 30 were over 19 years of age, 22 were due to all forms of Tuberculosis and 5 died from Syphilis.

31.2% or 2,604 cases of communicable disease were due to Rubella; 2,345 or 28.2% were due to Mumps; 15.5% or 1,327 were due to Chickenpox and 499 or 6.0% were due to Scarlet Fever.

ISOLATION HOSPITAL

Eight hundred and twelve patients were admitted to the Isolation Hospital during the year 1950. There were 48 outpatients and 17 patients died.

The admissions to the hospi	tal were	for the following causes:	
Scarlet Fever	371	Erysipelas	17
Diphtheria	6	Measles	29
Diphtheria carriers	2	Rubella	50
Poliomyelitis	65	Whooping Cough	7
Meningitis (meningococcic)	2	Chickenpox	12
Meningitis (tuberculosis)	5	Mumps	89
Tuberculosis	24	Septic sore throat	14
Typhoid Fever	1	Vincent's Angina	6
Typhoid carrier	1	Ringworm	11
Paratyphoid	4	Others	90
Encephalitis	6	•	
The deaths included:			
Scarlet Fever	3	Poliomyelitis	3
Measles	2	Tuberculosis (meningitis)	4
Diphtheria	1	Others	4

338 children were discharged, leaving 9,545 on the active roll.

4 senior interns, under Dr. D. B. Leitch, as consultant, attended the clinics during the year and examined 929 children.

There were 2,564 home visits made to problem cases and very young babies.

During the year there were 191 student days. These were made up of B.Sc. and Public Health nurses from the University of Alberta who were with us for observations at Clinics as well as home visiting, and student nurses from the University Outdoor Clinic, Royal Alexandra Hospital, Misericordia Hospital and new staff members from the Provincial Department of Health.
